Introduction

MPM281 high stable OEM sensor is the piezoresistive pressure sensor with isolated construction and precise compensation. It uses high stable silicon die, stainless steel 316L housing with diameter Φ 19mm. Wider temperature compensation and zero correction are calibrated by laser trimming technics. The measured pressure is transmitted onto silicon die through 316L diaphragm and inner media, to transform the pressure to electric signal. It can be filled with Fluorinated Oil. Because of its good biological inertness, it can dissolve a large amount of breathing gas, and can be quickly discharged from the human body. It is more suitable for the pressure measurement of the oxygen in medical applications.

MPM281 pressure sensor is inspected and screened on automatic production line, testing and checking time after time strictly. It is widely used for various pressure measurement fields.

Notes

- 1.It is recommended that the sensor should be installed as Suspended Mode to avoid face type seal and avoid affecting sensor stability.
- 2.Please pay attention to protect the diaphragm and the compensated board to prevent any damage or bad performance.
- 3.Temperature resistant range of standard Viton O-ring of sensor is -20°C ~250°C . When working temperature is lower than -20°C , or sensor is applied in critical
